IAM Automation

Phase 1 UAT Stakeholder Brief

Read-only identity reconciliation and audit platform

Prepared by
Miguel Fernandez
WFM Operations | Fullstack Developer

Stakeholder review package | 28 August 2026

Core principle: IAM Automation Phase 1 detects and explains. Humans decide. Authoritative source systems execute.

Purpose and WFM Operations visibility

This brief gives IAM stakeholders a concise view of what Phase 1 proves, what decisions remain with the business, and how WFM Operations contributes to a controlled identity reconciliation process.

My role in the project

Role	Contribution to IAM Automation
Miguel Fernandez WFM Operations | Fullstack Developer	Connects operational WFM needs with the working product: source ingestion, reconciliation, analytical identity views, evidence/history, reports, runtime safety, and stakeholder-ready UAT. The role helps make findings visible and explainable; it does not replace IAM, HR, or source-platform decision owners.
WFM Operations visibility	Brings attention to workforce populations, source cadence, roster coverage, exceptions, lifecycle observations, and the operational evidence needed for human review and follow-up.

What Phase 1 promises

Phase 1 does	Phase 1 does not
Ingest approved exports; preserve source and batch evidence; match observations; build an internal analytical identity; classify findings; preserve history; support human review; produce reports and evidence exports.	Hire or reject a hire; terminate or reactivate; change access; provision accounts; modify Fieldglass, AccessNow, Master Roster, Roster Lock, or Salesforce through a live API; execute ITSM changes; or make authoritative business decisions.

Visibility outcome: stakeholders receive an evidence-based view of what the sources show, what is uncertain, what may be late, and what requires human action outside the platform.

Phase 1 boundary and UAT at a glance

The operating flow ends at human review. Any action in an authoritative platform happens outside IAM Automation Phase 1.

Source exports -> **Ingest + normalize** -> **Match + reconcile** -> **Findings + evidence** -> **Human review**

UAT package summary

34 PHASE1_CORE rules	**8** PHASE1_PLATFORM rules	**9** Scenarios ready
20 Business-decision blocked	**3** Technically blocked / absent	**48** Open business questions

Scope	Meaning for stakeholders	Sign-off treatment
PHASE1_CORE	Reconciliation, matching, findings, evidence, review, reports.	Required for Phase 1.
PHASE1_PLATFORM	Authentication, authorization, audit, recovery, local runtime, analytical snapshot distribution.	Required for safe operation.
PHASE2_WRITER	Promotion, authoritative merge, approval, apply, ITSM, provisioning.	Deferred; does not block Phase 1.
FUTURE_INTEGRATION	Salesforce live/API and other downstream connectors.	Deferred; does not block Phase 1.

Important distinction: technical publication of a read-only analytical database is a platform operation. It is not publication of a business change.

What stakeholders need to validate

The UAT package is designed to expose dangerous ambiguity, not to convert current code behavior into an approved business rule.

Area	Stakeholder interpretation required
Identity matching	Which identifiers prove that observations belong to the same person? Uncertain matches must remain visible rather than being silently merged.
Source differences	A conflict does not always need a winner. It may be consistent, an expected difference, source latency, insufficient evidence, a discrepancy, or a policy-relevant finding.
Source timing	Snapshot date, effective date, received date, and data age must be distinguishable. Absence is not automatically an error before the approved latency window expires.
Rehire	Phase 1 detects a potential 30-day rehire condition only. It does not approve, reject, or execute the rehire. Calendar type, dates, holidays, boundaries, and fallback timestamps remain to be confirmed.
Evidence and exports	Reports must show the expected analytical population, exclusions, findings, control totals, and reproducible source evidence.
Read-only safety	Phase 1 must technically prevent authoritative lifecycle changes, downstream writes, provisioning, and automatic business decisions.

Top 5 Phase 1 risks

1	Wrong identity correlation from unapproved identifiers or fallback signals.
2	False-positive finding volume caused by normal source timing or expected differences.
3	Missed discrepancies caused by stale data being treated as current or absence being interpreted too early.
4	Incorrect potential-rehire alerts caused by unresolved date, calendar, or boundary semantics.
5	Accidental authoritative writer capability reachable from a read-only deployment.

Next IAM meeting: 10 decisions

#	Decision needed	Effect on UAT
1	Identity keys and proof of same person.	Matching and analytical identity.
2	Expected source coverage by population and lifecycle stage.	Missing-source findings.
3	Authority versus discrepancy when sources conflict.	Finding classification and reports.
4	Acceptable latency by source and population.	False-positive control.
5	Exact 30-day rehire detection rule.	Rehire scenarios and alerts.
6	Finding severity: Critical, Warning, Review, Informational.	Triage and notifications.
7	Known expected differences.	Avoids unnecessary discrepancies.
8	Evidence required to mark a finding reviewed/resolved.	Auditability and closure.
9	Operational owners for rules, mappings, schemas, calendars, and UAT.	Controlled maintenance.
10	Confirm boundary: IAM Automation detects/exposes; humans execute.	Mandatory read-only technical gate.

Recommended UAT execution order

Wave 1	Ingestion and lineage	Files, batches, schemas, quarantine, row counts, source evidence.
Wave 2	Identity reconciliation	Strong IDs, aliases, fallback signals, ambiguity, duplicate candidates.
Wave 3	Cross-source audit	Coverage, conflicts, latency, expected differences, discrepancies.
Wave 4	Lifecycle findings	Potential rehire, status inconsistencies, missing-source and policy-relevant findings.
Wave 5	Review, evidence and exports	Human review, history, report completeness, traceability, reproducibility.
Wave 6	Platform safety	Read-only enforcement, access control, audit, backup/recovery, snapshot distribution.

Phase 2 writer scenarios and future integrations are documented separately and must not block Phase 1 sign-off.

Recommended stakeholder message

Phase 1 is ready to demonstrate the reconciliation and audit promise, subject to decisions about identity evidence, source timing, expected differences, finding severity, review evidence, and technical read-only enforcement. The platform's value is visibility: it makes source observations comparable and explainable so the right human owner can act in the authoritative system.

Sign-off conditions

Before Phase 1 sign-off	Evidence of completion
Identity and finding rules	Approved identity evidence, conflict classification, coverage, latency, and rehire detection parameters.
Operational ownership	Named owners for sources, mappings, calendars, findings, review, and UAT decisions.
Platform safety	Negative tests prove no authoritative lifecycle mutation, downstream write, provisioning, or automatic business decision.
Evidence and recovery	Reproducible reports, audit events, backups, checksums, version visibility, and controlled analytical snapshot distribution.

Prepared for stakeholder circulation
