Next IAM Meeting Decisions — Phase 1 UAT

This is the primary decision agenda. It intentionally reduces the detailed backlog to ten decisions with the greatest effect on read-only reconciliation acceptance. Phase 1 detects and explains; humans decide; authoritative source platforms execute.

Item 10 confirms an already-approved business boundary. Its options are technical enforcement choices only; they do not reopen the decision that Phase 1 is read-only with respect to authoritative source systems.

#	Decision	Current behavior	Why decision is required	Example	Recommended options	Decision owner	Impact on UAT
1	**Identity keys:** Which identifiers prove two observations belong to the same person?	Strong IDs are preferred; NUID/employee/vendor/buyer aliases exist; email and exact name are fallbacks.	Matching controls canonical analytical identity, duplicate candidates, history, and exports.	Same name and email but different Worker IDs; same NUID under two sources.	A. Approve a cross-source key matrix. B. Require multiple independent signals. C. Surface as `INSUFFICIENT_EVIDENCE` until reviewed.	IAM Identity Owner	Blocks UAT-002–005 and 018–019 if unresolved.
2	**Source coverage expectations:** For each population/lifecycle stage, which sources should contain the person?	Reports expose source coverage; absence semantics are not complete.	A person missing from one source is not automatically an error.	A contractor appears in RSR but not Master Roster; a terminated worker remains in AccessNow during transition.	A. Define source-population matrix. B. Define expected optional sources. C. Treat unknown coverage as `INSUFFICIENT_EVIDENCE`.	IAM Data Owner	Blocks UAT-010, 014, 025, and lifecycle finding interpretation.
3	**Conflict handling:** When sources disagree, when should authority be used versus exposing a discrepancy?	Report engagement priority uses Roster Lock > RSR > AccessNow; it is not a complete field-level authority rule.	An auditor should not silently overwrite competing evidence.	Manager differs between Roster Lock and AccessNow.	A. Approve field-level authority. B. Preserve both as `DISCREPANCY`. C. Classify known valid difference as `EXPECTED_DIFFERENCE`. D. Use `SOURCE_LATENCY` or `INSUFFICIENT_EVIDENCE`.	IAM Data Governance Owner	Blocks UAT-006/007/015/020 and export interpretation.
4	**Source latency:** How long may each source legitimately lag before absence/difference becomes actionable?	Services retain some created/updated/effective data, but no common cadence/window model exists.	Prevents false positives from daily, periodic, or monthly refresh differences.	Employee appears in Roster Lock today but Fieldglass refreshes monthly.	A. Define cadence and allowed age per source/population. B. Use `SOURCE_LATENCY` until window expires. C. Escalate only after window.	IAM Operations + Data Owners	Blocks UAT-014/016/025 and finding severity.
5	**Rehire detection:** What exact 30-day rule, dates, calendar, and boundaries apply?	Code detects 0–30 business days, excludes start date, includes end date, supports optional holidays, and falls back to created timestamps when dates are absent.	Phase 1 may detect a potential condition but must not approve/reject rehire.	Termination Friday, proposed start Monday, holiday in between; missing effective date.	A. Calendar days. B. Business days with named calendar. C. No alert without authoritative dates. D. Explicitly approve fallback timestamps.	IAM Lifecycle Owner	Blocks UAT-011/012 and affects UAT-022/023.
6	**Finding severity:** What is Critical, Warning, Review, and Informational?	Critical notifications exist for some rehire/overdue/publication paths; no complete finding severity model exists.	Determines alert volume, triage order, and notification behavior.	Missing source within latency window versus conflicting termination evidence.	A. Severity matrix by finding class. B. Severity by population/lifecycle. C. Keep informational findings local only.	IAM Operations + Governance	Blocks finding acceptance and notification UAT-032/035.

#	Decision	Current behavior	Why decision is required	Example	Recommended options	Decision owner	Impact on UAT
7	**Expected differences:** Which known source mismatches are normal?	No formal expected-difference catalog was found.	Known timing, formatting, or population differences should not become false discrepancies.	Monthly source intentionally lags a daily source; vendor ID absent for internal employee.	A. Maintain approved expected-difference catalog. B. Require source/population/age conditions. C. Classify unknown differences as `DISCREPANCY`.	IAM Data Governance Owner	Blocks UAT-007/014/015/016 and false-positive control.
8	**Resolution evidence:** What must a reviewer capture to mark a finding reviewed/resolved?	Review, quarantine, and audit structures exist; evidence minimum and resolution vocabulary are incomplete.	Human review must be reproducible without turning the platform into an automated decision-maker.	Reviewer confirms source latency and records snapshot dates plus rationale.	A. Require reason, source evidence, timestamps, reviewer, and disposition. B. Separate “reviewed” from “resolved.” C. Never allow silent dismissal.	IAM Audit + Operations Owners	Blocks UAT-026/032 and audit sign-off.
9	**Phase 1 operational ownership:** Who owns rules, mappings, schemas, calendars, severity, and UAT decisions?	Mappings/configuration are embedded in services/config; tracker is still broadly Pending.	Rule drift can change matching and findings without controlled UAT.	A source header changes or holiday calendar changes the rehire result.	A. Assign owner per source/rule. B. Version changes and regression fixtures. C. Require Product/Data approval before release.	IAM Product Owner	Blocks production readiness and maintenance acceptance.
10	**Phase 1 boundary confirmation / technical gate:** IAM Automation detects/exposes; humans execute decisions in source systems.	The scope is approved, but the repository contains future promotion, merge, approval, apply, publication-queue, and writer-like routes alongside read-only documentation.	The approved boundary must be technically enforced, not inferred from user intent.	Allowed: “exists in Master Roster but not Fieldglass — REVIEW REQUIRED.” Not allowed: “terminate employee.”	A. Disable writer composition in Phase 1. B. Enforce feature/role gate. C. Separate writer deployment. In all options, technical snapshot publication remains platform-only.	Product + Security Owners	Mandatory gate UAT-027; failure blocks Phase 1 release.

Meeting output required

For each item, record the decision, owner, effective date, affected source/population, expected finding class, UAT scenarios, and whether an implementation change is required. Do not convert an unresolved item into an assumed expected result.
