Deferred Scenarios — Phase 2 Writer / Change Management

These scenarios remain documented because the repository contains related code and earlier design work. They are **not Phase 1 UAT requirements** and must not block Phase 1 sign-off.

Boundary

Phase 1 detects, explains, and exports evidence. Phase 2 writer capabilities would allow an authorized human/process to decide and execute authoritative changes in source platforms. Any future implementation must be separately approved, secured, audited, and tested.

Deferred scenario / source UAT ID	Deferred capability	Why it is not Phase 1	Future acceptance focus
UAT-012 extension	Rehire approval or reuse/new Worker decision	Phase 1 detects potential rehire evidence; it does not decide whether to rehire or execute it.	Decision authority, source-of-truth action, separation of duties, audit, rollback.
UAT-013 enforcement	No-hire block/reject/override	Phase 1 may classify a policy-relevant finding; it must not block or approve hiring.	Authoritative policy source, override authority, evidence, source-system action.
UAT-014 remediation	Correcting a missing source record	Phase 1 reports source absence; it does not alter Fieldglass, AccessNow, Roster, or other sources.	Remediation workflow, owner, authorization, source write audit.
UAT-021	Role/access change, provisioning, deprovisioning, ITSM	These are authoritative lifecycle/access actions.	Approval workflow, connector safety, rollback, downstream confirmation.
UAT-031	Duplicate merge execution	Phase 1 presents candidate identities and evidence; an authoritative merge is a business decision.	Merge authority, reversibility, referential integrity, evidence preservation.
UAT-033 live path	Salesforce API create/update	Current Phase 1 output is a manual evidence/handoff export.	API authentication, field mapping, idempotency, downstream ownership.
UAT-034	AD/Azure, CXOne, NICE, SQL, orchestrator, ITSM connectors	These are future integrations and are not required for current reconciliation acceptance.	Connector contract, environment, failure handling, security, support ownership.
UAT-048 equivalent	Request approval/apply/publication workflow	Internal request state machines and approvals are change-management behavior.	State machine, separation of duties, approval evidence, authoritative action boundary.

Required future gate

Before any deferred capability is enabled, create a new phase-specific scope decision and confirm that Phase 1 cannot reach the writer path accidentally. The technical snapshot publication used to distribute the read-only analytical database is separate and remains a `PHASE1_PLATFORM` capability.
